# DeepAlert Connect

AI FALSE ALARM FILTERING SOLUTION

DeepAlert's powerful AI false alarm filtering service for your monitoring system! Dramatically reduce false alarms and improve your monitoring performance with DeepAlert Connect!

# DeepAlert Connect

## FALSE ALARM FILTERING

False alarms can seriously impact the efficiency of monitoring operations and the ability to scale your operations. DeepAlert's AI false alarm filtering service accurately verifies alarms, by detecting what caused the alarm whether a human or vehicle and ignoring all other causes. The result: better morale of monitoring staff, less complacency and improved monitoring accuracy and speed.

## ACCURATE DETECTION IN CHALLENGING ENVIRONMENTS

Low lighting conditions, long distances from the camera and poor weather conditions are no match for DeepAlert's powerful algorithms. Triggers from rain, foliage movement, spider webs and pet/livestock movement are ignored and people or vehicles are detected even at long distances with poor contrast.

# DeepAlert Connect

## SIGNIFICANTLY FEWER ALERTS

Your interface is familiar to your operators. Keep it that way! Simply connect DeepAlert to your interface and enjoy significantly less false alarms and handle the “true” alarms as before. No need for any operator retraining.

## A QUALITY SERVICE CONFIGURED TO YOUR REQUIREMENTS

DeepAlert’s management interface enables you to configure settings to reduce false alarms:

- ▶ Multiple exclusion zones per field of view
- ▶ Different exclusion zones per schedule e.g. day and night
- ▶ Schedules for alarming
- ▶ A system confidence level threshold

## ENABLE “CO-MONITORING” - ALERTS ON MOBILE PHONE AS WELL AS IN THE CONTROL ROOM

Configure DeepAlert to deliver alerts to your client’s mobile phone using the Telegram app. The video clip or images of the alert appear with metadata enabling your client to view alerts and respond accordingly. On-site guards can be alerted immediately on their mobile phone enabling an immediate response.

# DeepAlert Connect

## MANAGE THE PERFORMANCE OF INSTALLERS AND EXPECTATIONS OF CLIENTS

DeepAlert's organisational structure of the system enables reports to be generated per group. Configure groups by client or installer. Provide automated, instant notifications to installers when their installations are off-line. Use scheduled reports of delinquent sites to manage installers performance and client's expectations. DeepAlert Connect's powerful reporting capabilities ensure better control of your monitoring operations.

## AN EVER-IMPROVING SYSTEM

The DeepAlert system is a global system that is constantly improving through regular iterations of training. On the management interface, you have visibility of the images "ignored" and you can "train" the system by flagging "incorrect" alerts and improve the system for all!

## COST EFFECTIVE SERVICE

The DeepAlert false alarm filtering service can be selected per camera ensuring that you get maximum utility for the service by selecting your most "troublesome" (highly alerting) cameras.

DeepAlert Connect is very competitively priced and scalable. There is no contract lock-in and no minimum number of cameras required for the service.

## DEPLOYMENT OPTIONS

Connect cameras to your video management system via the DeepAlert management interface or select the AI Video Analytics service from within your Alarm Receiving System such as Immix and Sentinel.

Either deployment is simple and can be done remotely.
